

Use of connective tissue substitutes in gingival recessions

Michael K. McGuire

The clinicians goal in soft tissue reconstruction is to maximize clinical outcomes while reducing morbidity. New devices are being introduced that may be able to achieve these goals. This program will explore connective tissue alternatives along with evidence based decision trees regarding when alternatives should be considered and how to improve outcomes. Participants will learn the objectives of soft tissue augmentation, compare various techniques and how they differ from the gold standard, and advantages of alternative therapy.
