

## THE TREATMENT OF SINGLE AND MULTIPLE CLASS 3 RECESSION WITH CORONAL ADVANCED FLAP: WHEN TO USE CONNECTIVE TISSUE?

**Francesco Cairo** (*Firenze I*)

Over the last decade, several studies have demonstrated the benefits of adding connective tissue graft (CTG) under coronally advanced flap (CAF) at single and multiple recessions, demonstrating that this could be considered the gold standard procedure. Furthermore, recent researches suggested that classical limits of gingival recession treatment may be overcome by modern techniques leading to predictable complete root coverage also at recessions showing loss of interdental attachment.

The aim of this lecture will be to evaluate factors indicating the use of CTG for root coverage procedures and clinical outcomes at recessions with or without the clinical loss of interdental attachment.
