

## EVIDENCE-BASED PERIODONTAL PLASTIC SURGERY

**Leandro Chambrone** (Sao Paulo BR)

Root coverage periodontal plastic surgery (PPS) procedures have long been used for the treatment of gingival recession (GR). During daily practice, clinicians are required to deal with diverse clinical scenarios and to provide the most adequate treatment options for each particular condition based on the best evidence available, the clinician's skills, and the patients' desires.

Therefore, this lecture aims to:

- 1 - Comment on the main factors influencing the predictability of root coverage procedures according to the different patient-, procedure- and outcome-related factors.
2. Discuss the main clinical scenarios depicted in the 2014 AAP Regeneration Workshop.
3. Translates evidence-based findings on soft tissue PPS of recession-type defects to daily clinical practice.
