

USE OF CONNECTIVE TISSUE IN CLASS 1 AND 2 MULTIPLE RECESSION

Virginie Monnet Corti (Marseille F)

The connective tissue graft is still, in the 21st Century, the gold standard in root coverage technique.

The aim of my lecture is to propose clinical reasoning and some "tricks" for the successful treatment in **class 1 and 2 multiple recessions** (based on scientific evidences).

It will concern how:

- to harvest connective tissue graft without any risk,
- to choose the best flap design to graft this connective tissue
- to assess the results in terms of complete root coverage and esthetic satisfaction.

It will be based upon several clinical cases, videos and scientific studies leading to discussions on the technical indications and alternatives. Some decision tree analyses will be proposed to help daily clinical practice.

I am looking forward to share with the participants my passion for perio-plastic surgery as applied daily in my office.
